Subjecthood, agency, and topicality in Lushootseed

David Beck
University of Toronto

The Salishan language Lushootseed is notable for its apparent lack of morphosyntactically transitive clauses, a fact which has led many of the descriptive works on this language to replace the syntactic terms “subject” and “object” with the semantic terms “agent” and “patient”. The implicit claim embodied in this practice that the syntactic subject is not an operative category in the language, however, is problematic from both a theoretical and a typological perspective. This paper offers evidence that there is, in fact, a syntactic subject in Lushootseed, albeit one which is closely aligned with the semantic category of agent, and that there are also transitive clauses whose existence is obscured by the presence a grammatical constraint against the realization of two non-oblique NPs in a clause. This results in the elision of the syntactic subject, its identity being preserved via identification with the discourse topic.

0 Introduction

One of the more notable characteristics of the Salishan language Lushootseed is the apparent absence of morphosyntactically transitive clauses—that is, clauses with two non-oblique NP or pronominal actants—with third-person agents. As it turns out, transitive clauses with two overt actants are possible only for clauses with first- or second-person agents, as shown in (1):¹

   (1) (a) ?u+gʷəχ̓+əd čəd ti sqʷəbəy? [pnt]+look-for+[caus] 1s D dog
       “I looked for the dog”

   (b) ?u+gʷəχ̓+əd čəxʷ ti sqʷəbəy? [pnt]+look-for+[caus] 2s D dog
       “you looked for the dog”

¹The abbreviations used here are as follows: 1 = first person; 2 = second person; 3 = third person; appl = applicative; caus = causative; cont = continuous; D = deixic; f = feminine; intj = interjection; irr = irrealis; l.o.c. = lack of control; md = middle; np = nominizing prefix; NTS = nontopical subject; P = preposition; p = plural; pnt = puncutal; po = possessive; prog = progressive; rdp = reduplication; refl = reflexive; s = singular; stat = static; trm = transmutative. Where necessary, these terms are defined in the text.
Expression of two overt third-persons in a clause requires the use of the middle or the passive voice, both of which result in intransitive clauses where either the agent or the patient is realized as an oblique actant expressed by a prepositional phrase:

(2)  
(a)  
\[ \text{?u+g}^{\text{ca}+\text{ab}} \quad \text{ti } \text{ca}^{\text{cas}} \text{ ?} \text{ ti } \text{sq}^{\text{obay}}? \]
\[ [\text{pnt}]+\text{look-for}+[\text{caus}] \text{ D boy P D dog} \]
"the boy looked for the dog"

(b)  
\[ \text{?u+g}^{\text{ca}+t+\text{ab}} \quad ? \text{ ti } \text{ca}^{\text{cas}} \text{ ti } \text{sq}^{\text{obay}}? \]
\[ [\text{pnt}]+\text{look-for}+[\text{caus}]+[\text{md}] \text{ P D boy D dog} \]
"the boy looked for the dog"
(lit. "the dog was looked for by the boy")

Facts such as these have led writers such as Jelinek & Demers (1983) to posit that Lushootseed, like some Interior Salish languages, has a split ergative system in which third-person NPs such as \( \text{ti } \text{sq}^{\text{obay}}? \) "the dog" in (1c) and \( \text{ti } \text{ca}^{\text{cas}} "\text{the boy}" in (2a) are—rather than direct objects—absolutive subjects and that PPs such as \( ? \text{ wi } \text{ca}^{\text{cas}} "\text{of the boy}" in (2b) would be ergatively-marked agents. While the primary researcher on Lushootseed, Thom Hess, does not accept the ergative analysis, he does feel that Lushootseed has a split system in the sense that sentences with third-person agents such as (1c) allow for only a single non-oblique actant, the "direct complement" (\( \text{sq}^{\text{obay}}? \) in (1) and (2b)), the absence of an overt agent-pronominal in the sentence in (1c) indicating that it is, in fact, intransitive. According to Hess (personal communication), this analysis renders the notion of "syntactic subject" largely extraneous to the treatment of Lushootseed grammar, a claim which seems to be upheld by his accurate and insightful descriptive work on the language.

Outside the immediate domain of Lushootseed, however, such a stand is highly problematic in that the syntactic role of "subject" (or its reflex in a particular theory) is widely held among linguists to be universal and, in fact, is a cornerstone of analysis in a wide range of frameworks such as Functional Grammar (Dik 1978), Lexical-Functional Grammar (Bresnan 1982), Cognitive Grammar (Langacker 1991), and virtually all dependency-based theories (e.g. Mel’čuk 1988, Hudson 1990). For these—and other theories which posit or derive the universality of subjects or subject-like syntactic roles—the lack of a syntactic subject in the Lushootseed clause would represent a major challenge. While issues such as this do not touch on the criterion of descriptive adequacy—which has certainly been met in the works of Hess and others to date—they are crucial in the context of cross-linguistic comparison and in the
search for widely applicable or universal principles for syntactic theory: thus, the claim that there is no syntactic subject in Lushootseed is an important one, and should be carefully scrutinized. In the paper that follows, I will examine the Lushootseed data and, in particular, sentences like those in (1) and argue that there is indeed an event-participant in such expressions that can usefully be referred to as the “syntactic subject”. I will also analyze some further properties of that role both with respect to its crucial function in Lushootseed discourse and its semantic function as a deictic for events—in other words, the pivotal role played by subjects in linking new participants and events to a known or topical entity in discourse. As we shall see, while the surface patterns of Lushootseed syntax are quite remarkable and unique, they are the result of the convergence of a number of properties of subjects and principles of discourse which are, cross-linguistically, by no means unusual or extraordinary.

1 Subject properties

Despite the fact that the terms “subject” and “object” are expressly avoided in the principle grammatical works on Lushootseed, many linguists feel that these categories—in particular that of “subject”—are universals of natural language (Keenan 1976; Perlmutter 1980; Mel’čuk 1988; Hudson 1990; Langacker 1991), and subject and object are widely held to play an essential part in the analysis of phenomena such as passivization, voice, and ergativity. Unfortunately, even among those who advocate the universality of “subject”, there is no agreement as to a universal definition: while the category may be active in all languages, the particular manner in which it manifests itself and the specific properties that it has in a given language can only be defined in terms of that language itself (Keenan 1976; Mel’čuk 1988). The extent of the consensus seems to be that the subject is, at the very least, “syntactically privileged” (Mel’čuk 1988: 161) in the sense of possessing some set of syntactic properties which (a) pertain (as a set) to no other clausal elements (Keenan 1976), (b) accord the subject the highest degree of clausal “salience” (Langacker 1991), and (c) make the subject “the argument to which the predication is attributed—that is, the primary syntactic argument of a sentence” (Bavin 1980: 2). In the context of a specific language, however, it remains to the linguist to determine which particular properties are diagnostic of the subject and to what extent subjects play a role in that language.

To this end, a number of attempts have been made at setting out methodological procedures for identifying subjects, two of the best and most comprehensive being those of Keenan (1976) and Mel’čuk (1988). The first step in identifying the subject in a language, according to both researchers, is to identify a “basic sentence type” (Keenan 1976) and to enumerate the syntac-

2 Cf. Foley & van Valin (1984), who challenge the universality of subject and posit instead the notion of “pivot”, which seems closely related (if not identical) to the characterizations of “subject” given here.
tic properties of the actants (participants) in such a clause in order to
determine which of them has the greatest number of those properties typical
of subjects cross-linguistically. More complex sentence types may then be
examined with an eye towards identifying which of the actants in these struc-
tures share the greatest number of properties with the subject of the basic sen-
tence. For Mel'čuk, the basic sentence type is formed on the monovalent (intransitive) verb, whose single actant is thus syntactic subject. In Lushoot-
seed, the actants of intransitive stems (when not NPs) are represented by a set
of pronominal clitics:

(3) (a) ?u+ʔəx̂  çađ [pnt]+come 1s "I come"
(b) ?u+ʔəx̂  çaļx̂ [pnt]+come 2s "you come"
(c) ?u+ʔəx̂  çaļ [pnt]+come 1p "we come"
(d) ?u+ʔəx̂  çaļap [pnt]+come 2p "you folks come"
(e) ?u+ʔəx̂  ə [pnt]+come 3s/p "[he/she/they] come"

(Hess 1993: 3–6)

The "ə" symbol here represents a gap left by elision in the surface syntax,
rather than a structural element such as a zero pronoun (see Mel'čuk 1988,
Chapter 8, for a discussion of syntactic or lexical zeros in Russian)—meaning,
in effect, that Lushootseed has only a two-person pronominal paradigm. In
sentences such as that in (3e), the absence of a subject-clitic seems to signal the
third-person (plural or singular) identity of the subject, which is identified
with the discourse topic and is—in context—unambiguous. This will be dis-
cussed in more detail in Section 2 below. Under the approaches proposed by
Keenan and Mel'čuk, participants represented by this pronominal
paradigm—along with the "ə" or elided element—can be put forward as can-
didates for subjecthood and their syntactic properties can then be compared to
those typical of subjects cross-linguistically, as can the syntactic properties of
the full NPs with which they can be interchanged. In Lushootseed, subject
prononinals and elided third-persons in corresponding syntactic roles share a
number of properties singled out in the literature which identify them as
potential subjects and which set them apart from the "direct complements" in
bivalent clauses. These properties will be enumerated and discussed in the
sections that follow.

3When a pronoun-like element is absolutely required for some purpose in discourse, the role of
the third-person pronoun is filled by a deictic, which behaves syntactically as a full NP. In the
examples throughout the remainder of this paper, elided actants will be shown with a "ə" in
interlinear glosses to indicate the presence of the actant in the semantics and the syntactic
structure of the clause.
1.1 Agentivity (Keenan 1976; Langacker 1991)

Very typically across languages, subjects, particularly in transitive constructions, tend to be agents or at the very least initiators of events and actions (see also Hopper & Thompson 1980; Kemmer 1993). This tendency is also an essential element of Dik’s (1978) Functional Grammar, which works on the principle of “alignment” between pragmatic, syntactic, and semantic roles and takes the basic, unmarked mapping between semantics and syntax to be agent > subject. This is an important observation for us here, as in Lushootseed (and perhaps in other Salishan languages—Kinkade 1990) there appears to be a very strong correlation between the semantic role of agent and the syntactic role of subject—so much so that previous treatments of Lushootseed have substituted the terms “agent” and “patient” for “subject” and “object” with a great deal of success. One place where this practice falls down, however, is with verbs of perception, where the single actant of an intransitive clause (4a)—as well as the actant represented by the pronominal clitic in a transitive clause (4b)—takes the semantic role commonly referred to as “experiencer”:

\[(4)\]

(a) əʔəsʷ+laq ə
[stat]+listen 3
“[he/she] was listening”  
(Bates et al. 1994: 136)

(b) əʔəsʷ+luu+d čəd ə
[stat]+hear 1s 3
“I hear [it]”  
(Bates et al. 1994: 139)

(c) əʔəsʷ+suu+c čəd tə haʔɬ stubš
[stat]+see+[appl] 1s D good man
“I am looking at the good man”  
(Bates et al. 1994: 214)

Note also that in such sentences the semantic role of “patient” is not precisely the role that the observed actants are said to take, nor is the role of the subject in (c) exactly the same as that in (a) and (b). In the first two sentences, the focus of the clause is the interaction (however passive) of observer and observed, whereas the typical analysis of a sentence such as (c)—given the applicative morphology—would be that it focuses attention more on the observer’s act of directing their attention towards the observed.

One way around this difficulty would be to posit the conflation of the role of agent and experiencer for syntactic purposes, or to even define a new role which encompasses agents, experiencers, and observers of the type illustrated in (c) above, much as Davis & Saunders (1989) have done for Bella Coola (cf. also Foley & van Valin’s 1984 notion of the “macrorole”); however, this solution runs into an additional, more serious, difficulty in sentences formed on bare radicals denoting actions that are high on Hopper & Thomp-
son's (1980) scale of semantic transitivity. In these constructions, it is typically
the object or patient of the corresponding transitive event which is realized by
the pronominal or single overt NP, as in (5):

(5)  (a) ?u+pus  čəd
[pnt]+be-hit-by-flying-object  1s
"I [am/was] struck (by a flying object)"

(b) ?u+pusu+d  čəd  ø
[pnt]+be-hit-by-flying-object+[caus]  1s  3
"I pelted [him/her/them]"

(c) ?u+caxʷ  čəd
[pnt]+be-struck-with-a-stick  1s
"I got hit"

(d) ?u+caxʷa+d  čəd  ø
[pnt]+be-struck-with-a-stick+[caus]  1s  3
"I struck [him/her/them]"

(Hess & Hilbert 1976: II, 136)

(e) ?u+caxʷ  ti  sqʷəbay?
[pnt]+be-struck-with-a-stick  D  dog
"the dog got hit"

(f) ?u+caxʷa+d  ø  ti  sqʷəbay?
[pnt]+be-struck-with-a-stick+[caus]  3  D  dog
"[he/she/it/they] struck the dog"

(my sentences)

In the (a) and (c) sentences the pronominal—representing the only actant of
an intransitive clause, and therefore qualifying as a clausal subject (Meltzuk
1988)—seems to represent the semantic role of goal or patient, while in the
transitive clauses in (b) and (d), the same pronominals correspond to the
agent. The contrast between (e) and (f), however, which have direct comple-
ments, shows a shift in the semantic role taken by ti sqʷəbay?, and also shows
the inclusion of an (elided) agent in the profile of the event in (f), an agent
whose identity would normally be recoverable from discourse.

The same kind of pattern is seen in passives (see, however, Section 1.6
below for a discussion of the term "passive" in Lushootseed, which is far
from uncontroversial). In such sentences, an actant realized by a pronominal
element (or one which has been elided) will typically take the patient rather
than the agent role, as in (6) (the passive is realized here by the combination
of the causative -caxʷ with the middle suffix -b):
Thus, the function of the pronominal elements seems not to be tied absolutely to a given semantic role at all, but instead to a particular syntactic function. A potential solution to this problem is to define the pronominals as a special set of lexical items—or, in the terminology of Hess (1993), “čad-words”—and then to define the syntactic behaviour of the set in essentially the manner illustrated above, based on the association between these items and the varying semantic roles they play in with given verbs and in certain voices. Such an approach is, of course, completely adequate from a descriptive point of view: however, it misses not only the syntactic parallels between sentences with agents expressed as čad-words and those with elided third-person agents, but it also begs the question of the nature of the čad-words in the lexicon and whether or not they have a syntactic status comparable to similar elements in other languages and/or recognizable cross-linguistic functional parallels. In addition, a number of researchers have commented on the importance of making a separation between semantic and syntactic aspects of a sentence and of distinguishing clearly the basic units of the two “modules” or “levels” of the grammar—see in particular Dik (1978), Givón (1984), Mel’čuk (1988), Hudson (1990), Pollard & Sag (1994) (see also Mel’čuk 1988 and Bavin 1980 on the pitfalls of using semantic roles to establish syntactic categories)—and from a theoretical point of view it seems preferable to try to account for the behaviour of an element which seems to be definable on morphosyntactic rather than semantic grounds in terms of a syntactic role—such as that of subject.
1.2 Relativizability (Keenan 1976; Keenan & Comrie 1977; Mel'čuk 1988)

Across languages, syntactic subjects are a legitimate target for the formation of relative clauses, direct questions, negatives, etc., and are, in fact, the first target of these processes in most, if not all, languages in that they occupy the top of the Accessibility Hierarchy (Keenan & Comrie 1977) which states that if only one syntactic role is accessible to relativization and related processes, it will be the subject. In Lushootseed sentences with first- or second-person subjects and third-person objects, relative clauses (RCs) can be formed quite comfortably on objects, but in sentences with third-person subjects and objects, only the subject itself may be relativized, as in (7):

(7) (a) ?u+šud+dxw  čət ti  čəčas ?u+təs+əd  čəd
    [pnt]+see+[l.o.c.] 1p D boy [pnt]+be-hit+[caus] 1s
    "we saw the boy that I hit"

(b) ?u+šud+dxw  čət ti  čəčas ?u+təs+əd  tiʔh stubš
    [pnt]+see+[l.o.c.] 1p D boy [pnt]+be-hit+[caus] D man
    "we saw the boy [that] hit the man"
    *"we saw the man that the boy hit"

(Hess & Hilbert 1976: II, 125)

Where English would make use of an object-centred RC, Lushootseed uses a passive construction in the embedded clause, thereby avoiding the object-centred form, as in:

(8) ?u+šu+dxw  čəd ti  sq"əbay? ?u+čax"a+t+əb  ?ə
    [pnt]+see+[l.o.c.] 1s D dog [pnt]+clubbed+[caus]+[md] P
    tiʔh  čəčas
    D boy
    "I see the dog [that] the boy hit with a club"
    (lit. "I see the dog [that] was hit with a club by the boy").

(Hess & Hilbert 1976: 124)

The passivization of the lower clause allows the formation of a subject-centred—rather than an object-centred—RC. This is most likely a pragmatic constraint on the language, as there is no direct means other than the passive for allowing both of two third-person actants in a clause and so, if object-centred forms were allowed, they would be identical to subject-centred RCs in which the roles of the actants were reversed (that is, ti sq"əbay? ?učax"ad tiʔh čəčas would mean either "the dog that the boy hit" or "the dog that hit the boy"—cf. (7b) above). What this means in terms of the analysis here is that in clauses such as the embedded RC in (7b) above, the elided third-person participant that surfaces in the matrix clause as the head of the RC—ti čəčas "the boy"—should be analyzed as coreferential with the (elided) subject of the subordinate clause. To do otherwise—that is, to posit that the overt NP in the embedded clause, tiʔhstubš "this man", is the subject and the "extracted" NP
is coreferential with the object (or some other lower rung on the hierarchy)—would be to occasion a violation of the Accessibility Hierarchy in that objects would be relativizable while subjects would not be. Given the robustness of the Accessibility Hierarchy in language after language, it seems preferable to opt for the analysis of the head of the RC in (7b) as being coreferential with a subject elided from the embedded clause, much as subjects are elided in subject-centred RCs in English (e.g. “we saw the boy that ø hit the man”).

1.3 Possessors of participles (Langacker 1991; Taylor 1994)

When a clause undergoes nominalization to form a gerund or participle, in many languages the actant which corresponds to the subject of the finite clause is realized in the role of possessor. This is true for Lushootseed, which uses nominalized clauses corresponding to English participles to realize oblique-centred relative clauses and to form complex NPs from finite clauses (Beck 1995), and in each case the participant realized as a pronominal in a non-nominalized clause is realized as a possessor when that clause is nominalized. Consider (9) (relevant participles/verbs are underlined):

(9) (a) ?u+?abyid Ød ti ḍaṭas ?a ti sqʷəbay?
[pnt]+give 1s D boy P D dog
“I gave the dog to the boy”
(Hess 1993: 50)

(b) xʷəl pəxəxʷ tiʔaʔ d+sq+?abyid
only worthless D 1po+np+give
“what I give [to him] is only junk”
(lit. “my given [to him] [is] only junk”)
(Hess 1993: 185, line 14)

(c) ?u+?abyid ø ti ḍaṭas ?a ti sqʷəbay?
[pnt]+give 3 D boy P D dog
“[he/she] gave the dog to the boy”
(Hess 1993: 50)

---

4In the discussion of English grammar, a distinction is traditionally made between participles and gerunds, the former filling an attributive role in a sentence and the latter acting as a nominal (Trask 1993). Aside from the facts of their distribution, however, the two categories seem to be identical and most likely reflect two uses of the same type of lexical item, a clause which has undergone a certain degree of recategorization as a noun. In Russian, the term “participle” is used to refer to the attributive usage of this class of nominalization, coinciding with the English usage, whereas in some discussions of Altaic languages such as Turkish (e.g. Comrie 1981) “participle” is used for both substantive and attributive roles; the term “gerund” is more often used in Altaic (Comrie 1981; Poppe 1970), Spanish (Solé & Solé 1977), and in traditional Russian grammars (e.g. Pulkina 1982) to refer to what are more accurately described as “verbal adverbs”. For this reason I have chosen the term “participle” rather than “gerund” to use here, although the uses of these will be discussing here are primarily nominal.
(d) /lists  paxaX  tihat s+abyid+s  tihat cha?
only worthless D np+give+3po D stone
"what he gives to Stone is only junk"
(lit. "his given to Stone [is] only junk")

(Hess 1993: 187, line 32)

In the sentence in (b) the possessor of the participle s?abyid "giving" is represented by a first-person possessive affix (d-) and corresponds to the participant represented by the pronominal in (a); similarly, the third-person possessor in (d) corresponds to the elided (a) actant in (c), indicating that it is likely this elided actant rather than the overt NP tïčas "the boy" that is the subject of the clause. When the subject of a participle is an overt third-person NP, it also surfaces as a possessor, as in (10):

(10)  ušudxw  tihat s+as+tqwu?  wa tihat uišad+s  wa al tihat?
[pnt]+see D np+[stat]+gather P D relatives+3po P D
hikw cha?
big stone
"[he] saw the gathering of his relatives by the big stone"

(Hess 1993: 185, line 3)

Here, the subject of the clause nominalized as the participial sasqwu? "gathering" is tihat uišads "his relatives" which is realized as a possessor, marked by the preposition wa. Compare this to the corresponding finite clause,

(11)  asqwu?  tihat uišad+s
[stat]+gather D relatives+3po
"his relatives are gathered"

(my sentence)

in which the subject is not set off by a preposition, or

(12)  as+tqwu?  çeI
[stat]+gather 1p
"we are gathered"

(my sentence)

in which the pronominial occupies the same syntactic slot and takes the semantic role of tihat uišads in the two preceding sentences. Thus, it appears that whatever participant in the finite clause corresponds to the pronominal will be realized in participles as a possessor—and is an excellent candidate for subjecthood.
1.4 Control of reflexivization (Mel’čuk 1988)

Cross-linguistically, Mel’čuk (1988) observes that the subject is the actor with a reflexive verb. This is true in Lushootseed for the participant-role represented by the pronouns, as in (13):

(13) (a) ?u+ʔəl+tu+bš
[pnt]+eat+[caus]+1s-object 3
“[he/she] feeds me”

(b) ?u+ʔəl+tu+but čod
[pnt]+eat+[caus]+[refl] 1s
“I feed myself”

(Hess 1993: 55)

(c) ?u+q“ulu+t+s
[pnt]+hug+[caus]+1s-object 3
“[he/she] hugged me”

(my sentence)

(d) ?u+q“ulu+t+sut ø
[pnt]+hug+[caus]+[refl] 3
“[he/she] hugged him/herself”

(Hess 1993: 56)

In the (b) and (d) sentences, the pronominal/elided third-person participant seem to correspond to the actor/agent in the (a) and (c) sentences. While it might be possible to interpret the elided NP in (d) (or the pronominal in (b)) as referring to the semantic patient/syntactic object of the action, this seems unlikely, particularly given the appearance of the reflexive morpheme, which behaves much like the object/patient suffix -bš “me” in (a). As Kemmer (1993) notes, reflexives across languages tend to follow the pattern of the prototypical transitive event in which a subject/initiator is construed as acting on a patient/endpoint that is represented by a reflexive element indicating the identity of this endpoint with the initiator itself. Under this analysis, the reflexive suffix would in fact be a member of the object/patient suffix paradigm and the pronouns/elided NPs in (b) and (d) would then be taken as subjects.5

In fairness, it should be pointed out that direct complements also control reflexivization, as in:

(i) tilɔb  tu+ʔəl+kat+t+sut tiʔaʔ past+eat də’ex al tiʔaʔ agʔals+bid
suddenly [past]+squeeze+[caus]+[refl] D whites into D clearing+location
“the white people squeezed themselves into the middle of the clearing”

(Hilbert 1995: 60, line 335)

However, given that reflexive clauses have only a single syntactic actant—making them, in effect, intransitive (or, if we opt for a gradual scale of transitivity à la Hopper & Thompson 1980,
1.5 Pronominals and conjoinability (Keenan 1976)

Across languages, subjects are generally realizable as morphologically independent pronouns and, according to Keenan (1976), if a language has a single set of such elements particular to a given syntactic role, this role will be that of subject. The Lushootseed pronouns or čəd-words fit into this category quite nicely, being morphologically independent wordforms (clitics) which are not bound to a particular lexical element in the clause but appear obligatorily in sentence-second position:

(14) (a) ?əs+laqil čəd
    [stat]+late 1s
    "I [am] late"

    (b) day'+əxʷ čəd cīkʷ ?əs+laqil
        indeed+now 1s very [stat]+late
        "indeed, I am very late"
        (Hess 1993: 116)

    (c) tūʔal čəd sqajət
        P 1s Skagit
        "I'm from Skagit"
        (Bates et al. 1994: 6)

In the sentence in (a), the pronominal appears in its "normal" position following (and phonologically cliticized to) the verbal predicate of the sentence; in (b), however, the appearance of an adverbial particle in the clause triggers the "fronting" of the pronominal to immediately follow that particle. Note that the pronominal follows only the first adverbial and will precede any additional particles, occupying sentence-second (Wackernagel's) position. The sentence in (c) illustrates much the same point, although here the pronominal interrupts contiguity of a prepositional phrase—the sentence-second constraint apparently overriding the requirements of continuous constituency.

Another property of subject pronominals that Keenan points to is their ability to be conjoined with full NPs, as in (15):

(15) lə+ʔibəš čəl ?i tə mələ
    [prog]+walk 1p and D Mary
    "Mary and I are walking"
    (Hess & Hilbert 1976: 141)

Object pronominals, on the other hand, are suffixes and may not be conjoined with full NPs, conjunction of objects requiring the use of full nominals.

"less transitive")—it seems non-problematical to treat the non-oblique NP in (i) as the subject, just as the non-oblique NP in middle forms (2) and with bare radicals (5e) would be.
1.6 Passivization (Keenan 1976; Mel'čuk 1993)

The syntactic subject is widely recognized to be the syntactic actant that is "demoted" to an oblique role via passivization, the "promoted" actant becoming the subject of the new sentence. In Lushootseed the passive is formed by the combination of an applicative or any causative with the middle suffix -b, as in:

(16) (a) ṫu+ʔay'+dx' cəd tsi čəčas
    [pnt]+find+[l.o.c.] 1s Df child
    "I found the girl"
    (Hess 1993: 24)

(b) ṫu+ʔay'+du+b cəd ʔə tì čəčas
    [pnt]+find+[l.o.c.]+[md] 1s P D child
    "the boy found me"
    (lit. "I was found by the boy")
    (Hess 1993: 34)

In (a) the subject pronominal cəd corresponds to the semantic role of agent, yet in (b) the pronominal represents the goal of the action, the agent/subject of (a) having been demoted to a peripheral role in the sentence. However, Hess (personal communication) does not agree that such sentences are passives, particularly in the third person, as in examples such as (17):

(17) (a) ṫu+ʔay'+dx' tì sqʷəbay?
    [pnt]+find+[l.o.c.] D dog
    "[he/she] found the dog"

(b) ṫu+ʔay'+du+b ʔə tì čəčas tì sqʷəbay?
    [pnt]+find+[l.o.c.]+[md] P D child D dog
    "the boy found the dog"
    (lit. "the dog was found by the boy")
    (Hess 1993: 29)

For Hess, the sentence in (a) has only one actant, the direct complement, which also surfaces in the non-oblique position in (b) and, hence, undergoes no change in syntactic role. Under our analysis, however, these sentences do show a standard passive permutation in that the subject of the sentence in (a) is taken to be an elided actant "[he/she]" corresponding to the pronominal in (15a), whereas the subject of the sentence in (b) is taken to be the single (and

---

6Note that the pragmatic uses and thematic structure of the Lushootseed passive are completely different from those of its English counterpart (hence the active glosses); in discourse terms, the Lushootseed passive may fall into the functional category of "inverse" (Thompson 1989; Givón 1994). Jacobs (1994) offers such an analysis for the corresponding voice in Squamish based on statistical studies of topicality properties; it remains to be seen what the results of applying this method to Lushootseed would be.
only possible) non-oblique NP, *ti sq”əbay?* “the dog”. This conforms to the definition of the passive voice of Mel’čuk (1993) as an inflectional category which involves the permutation of the grammatical role of subject with that of one other participant in the clause (usually the direct object).

Hess’s objections to the analysis of the sentence in (17b) as a passive come largely from the absence of an overt element in (a) that can be analyzed as having undergone demotion in (b). While some evidence for the “presence” of an elided subject in the syntax has already been offered in other portions of this paper, specific support for the term “passive” (and the consequent existence of an elided subject) can be found by contrasting passives with the corresponding middle and intransitive forms as in (18a) and (b):

(18) (a) (i) ʔu+gʷəɬ+əb  ti  daqas ʔə ti sqalitut
  “the boy looked for a guardian spirit”

(ii) ʔu+gʷəɬ+i+əb  tə ti daqas  sqrt əbay?
  [pnt] + look-for + [caus] + [md] P D boy D dog
  “the boy looked for the dog”
  (lit. “the dog was looked for by the boy”)

(b) (i) ʔu+uləx  ti  lu’h ʔə ti bəsq”
  [pnt] + forage D old P D crab
  “the old man foraged for crab”

(ii) ʔu+uləx+t+əb  tə ti lu’h ti hud
  [pnt] + forage + [caus] + [md] P D old D firewood
  “the old man kept the wood [that he had found]”
  (lit. “the wood [that he had found] was kept by the old man”) (Hess 1993: 38)

In (a-i) “old man” is the subject and agent of the clause and is realized as a syntactically non-oblique actant, while in (a-ii) passivization makes another participant non-oblique and demotes “old man” to a prepositional phrase. Likewise, in the middle in (b-i) it is “boy” (the semantic agent) that is the subject of the sentence, whereas when the sentence is passivized, as in (a), the semantic goal becomes the subject and “boy” becomes oblique. Like the shift in semantic role of the subject pronouns in (16), the shift of the third person subjects in (b) and (d) to a peripheral syntactic position is diagnostic of the passive voice, which in turn argues for the status of the non-oblique actants in passivized sentences as syntactic subjects.

7 Note also that the presence of this non-oblique NP in the clause excludes the presence of a pronominal (that is, *ʔuʔa’dub ədə ti sq”əbay?* “I found the dog”), ruling out its interpretation as an object as in the active sentence
1.7 Non-deletability, topicality, and switch reference

Another property of the syntactic subject is that, in semantic terms, its referent can never be removed from the event's "profile"—the construal or mental model of the event as it is presented by the speaker (Langacker 1991)—in the sense that the event which the clause describes will always have an identifiable (or, in some cases, elemental/abstract) participant corresponding to the subject role in the clause (Mel'čuk 1988). Note that this does not prohibit the elision of the subject—that is, the non-realization of an understood (and hence semantically present) participant. Elision should not be confused with deletion, which would remove the idea of that participant from the clause entirely. Compare, for example, the meaning of "this book has been sold", which implies an unnamed seller who has been elided from the sentence, and "this book sells well", which profiles only an abstract series of commercial transactions but in no way includes a seller, the seller having been deleted from the profile of the clause. In practice, Lushootseed subjects are more often elided than not, due to a general surface constraint in Lushootseed grammar against the realization of two overt third-person NPs in a matrix clause, most likely a result of the absence of case-marking or rigid word-order requirements to differentiate the roles of third-person participants. However, even though a third-person subject in a transitive clause undergoes obligatory elision, in every case the identity of the subject is understood (or at least assumed by the speaker to be understood) from the context of the discourse and so is included by the speaker (and hearer) in the profile of the event. Consider the sentences in (19):

(19) (a) ?u+talawi+s Ø ti sqig"ac
[pnt]+run+[appl] 3 D deer
"[he/she] ran after the deer"

(Hess 1993: 15)

(b) ?u+šuu+c Ø ti?h sd"alaɬad
[pnt]+see+[appl] 3 D berry
"[he (Bear)] looked at the berry"

(Hess 1993: 193, line 25)

In these sentences, the actors—the runner in (19a) and the perceiver in (b)—are not named, yet they are, in context, quite unambiguous; this means, in effect, that the missing participants are still included in the event-profile and so have been elided rather than deleted. Thus, even though the syntactic subject is not realized overtly in the clause, its identity is recoverable from discourse by dint of the fact that the subject seems to be almost invariably the discourse topic.

The highly topical nature of subjects is a well-known and well-documented property across languages (Keenan 1976; Givón 1979; Li & Thompson 1979), which may be a result of their origin (in at least some languages) via
grammaticalization from topics (Givón 1979). Langacker (1991) treats a topic as
an entity which acts as a primary figure for a stretch of discourse with refer-
ence to which clausal participants are identified; cross-linguistically, discourse
topics may be clausal participants themselves—most commonly subjects
(Givón 1979; Li & Thompson 1976)—but they may also be non-participants
and serve as a more general reference-point to which the clause as a whole is
related. Lushootseed seems to have a pragmatic constraint that requires the
discourse topic to be both a clausal participant and to be identified with the
clausal subject. Consider once again the example from (19b). Here, as noted
above, the subject of the sentence is in context quite unambiguous as the sen-
tence occurs in a stretch of discourse in which the topic has been identified as
"Bear". Once established as the discourse topic, Bear is held in the minds of
the speaker and the listener as a reference-point for identifying the central
figure in the discourse episode—and hence the syntactic subject—for subse-
quent text, although its overt expression in active transitive clauses is ruled
out by the constraint against two overt NPs mentioned above. This results in
a pattern in which the primary figure in discourse is often the one that
receives the least overt expression, a pattern not unlike that found in more
familiar null-subject languages like Chinese (Li & Thompson 1979), where
the topical subject is often left unrealized, to be filled in by context.

Because of the importance of the requirement that the syntactic subject
be coreferential with the discourse topic for the recovery of the identity of elided
actants, Lushootseed has (or had) a special morphological marker in
clauses that violate the subject = topic constraint. This marker seems closely
related to one of Keenan's (1976) diagnostics for subjecthood, that of switch
reference, wherein changes of subject in discourse often trigger the use of
grammatical "switch reference" markers. In conservative Lushootseed style,
the Non-topical Subject Marker (NTS) -ag"a'id is added to a verb whose subject
is not the discourse topic (Kinkade 1990; Hess 1993). Consider the text in (20):

(20)  (a) ?u+k"eada+d  tiʔə?  pəəəəəəəəəəəəəs
   [pnt]+take+[caus] D bobcat-blanket+3po
   "(he (Bobcat)) took his bobcat-blanket"

(b) g"al ?al+d  k"ediʔ  ?adəlus
   and be-located+[caus] there beautiful
   "and [he] put it in a beautiful [place]"

(c) g"al la+g"əəd+il  ?æx"+ŋəg"+us
   and [cont]+be-seated+[trm] [stat+locative]+towards-sea+face
   "and [he] sat facing the water"

(d) dikiʔ  k"i s+šu+d+ŋəg"id  ?ə tiʔə?  əčəs
   sudden D np+see+[caus]+NTS P D child
   "all of a sudden the child saw him"
   (lit. "the seeing [him] of the child [was] sudden")
(e) ‘díξ+əw’ bayə?
this-one+now daddy
“that’s Daddy,“

(f) ‘díξ+əw’ bayə?”
this-one+now daddy
“that’s Daddy”

(g) di̱ ti pəcəb ti ?u+cut+t+əb ?ə tiʔə?
this one D bobcat D [pnt]+speak+[caus]+[md] P D
sqaqagʷəⱡ
noble-child
“it was Bobcat whom the noble child spoke of”
(lit. “the one spoken of by the noble child [was] this one, Bobcat”)  
Hess 1993: 151

This text occurs in a discourse episode where the topic is Bobcat. Bobcat surfaces in every sentence in which he is a participant as the grammatical subject except in (d), which is marked with the Non-topical Subject Marker. Note, however, that since the -agʷəd suffix does not mark a lasting shift in syntactic subject, but instead marks the subject of a single sentence as being non-topical, Kinkade (Hess, personal communication) has argued that it is not in a strict sense a switch-reference marker, which usually serves to indicate a more permanent change of syntactic subject. Nevertheless, it seems close enough in function to switch-reference that the substance of Keenan’s criterion (that changes of syntactic subject are often marked overtly in the grammar) can be extended to include this morpheme as well, making it yet another diagnostic for subjecthood and of the relation between subject and discourse topic, something to be explored in more detail in the Section 2 below.

1.8 Summary: Transitivity, voice, and valency

In the final analysis, the majority of subject-properties that we have found to be applicable to Lushootseed point to the əəd-words and elided third-persons as syntactic subjects; in intransitive clauses, these properties are also shared by the single non-oblique NP, the direct complement, which therefore also qualifies as subject. This coincidence of the role of syntactic subject and Hess’ “direct complement”, in fact, holds for all of voice and valency alternations of the Lushootseed verb except the active-transitive (Hess’ “patient-oriented”) clauses, as shown in (19), which lists the types semantic role taken by əəd-words, elided third-persons, and direct complements in the various types of voice and valency alternation (initiator = agent/experiencer; endpoint = patient/theme/goal). Here we see that in non-transitive clauses, the sole non-oblique actant represents the same event participant and so corresponds to the same syntactic role, that of subject. In the active-transitive clause, however, the direct complement represents a distinct event-participant from that repre-

sented by a pronominal or an elided third person. This discrepancy is, not unexpectedly, borne out by the differences in syntactic behaviour enumerated in the previous sections: in the majority of cases, the diagnostics for subjecthood apply to the pronominal clitics and elided third-persons rather than the NP direct complements. These results are summarized in (22):

*if agent is not third-person

As the table shows, əd-words and ə third-persons share a large number of subject-properties and they also share more of these with each other than they do with the direct complements, which in fact show very few of the syntactic characteristics that we would expect of them were they subjects. The fact that they do not behave as subjects but are not marked as oblique seems to indicate that they are best analyzed as direct objects in syntactically transitive clauses, constructions which are governed in Lushootseed by an unusual constraint that no more than a single non-oblique NP appear in the clause—a constraint that appears to be shared (but less strictly applied) by a number of other Salishan languages. Given the absence of a third-person pronominal, this results in the remarkable pattern shown in (1), wherein transitive clauses with third-person subjects undergo obligatory subject-elision, the recovery of the subject's identity depending crucially on discourse.
2 Subject, topic, and discourse

Having made something of a case up to now for the existence of the syntactic subject in Lushootseed, there is still the question of to what degree this category plays a role in the syntax of the language. It has been noted by a number of researchers such as Keenan (1976) and Langacker (1991) that while the role of subject may be universal, its relative importance in the grammar may vary from language to language; this sort of observation has led Li & Thompson (1976) to propose a parameter of typological variation which would distinguish between “topic-prominent” and “subject-prominent” languages, the syntax of the latter revolving around the syntactic subject and that of the former around the discourse topic. While certain aspects of Li & Thompson’s typology have come under fire, particularly from advocates of the universality of subjects (see, for example, Bavin 1980), it is nevertheless a valid observation that the role of subject may be more or less prominent in the syntax of a given language, and that that prominence is often tied in some way to the notion of discourse topic. Lushootseed is a case in point. In this language, as witnessed by Hess’s incisive descriptive treatments, the syntactic role of subject seems in many ways to be a less central one than it is in a subject-prominent language such as English, the subject role being describable largely in terms of the discourse notion of topic and the semantic role of agent, with both of which it is closely aligned (in the sense of Dik 1978). At the level of the individual clause, the role of syntactic subject is nearly interchangeable with the semantic role of agent/experiencer, making Lushootseed what might be described as an “agent” or “initiator-prominent” language; because of the highly topical nature of this role in Salishan discourse in general (Kinkade 1990), in Li & Thompson’s (1976) typology Lushootseed also seems to be a topic-prominent language, although unlike the other languages classified by Li & Thompson under this heading, Lushootseed seems also to have a strong candidate for syntactic subject.

The equation of discourse topic and subject has other important consequences as well. As noted above, Langacker (1991) defines a topic as an entity that serves as a reference-point against which events and other clausal participants are identified in a given stretch of discourse—an essentially deictic function. This comparison between the discourse function of subjects and the function of deixis becomes clearer in the context of the Cognitive Grammar definition of deictics as “tokens” that represent instances of things or events in the “domain of instantiation”, defined as:

(23) **Domain of Instantiation** (DI): the mental map on which items in discourse are located by the speaker and identified with things that are known, can be seen, or are presupposed to exist by the hearer.

The role of the deictic—as its name implies—is to point out the location of specific examples or instances of a type in the DI relative to the speaker, usually in spatial terms or by spatial analogy (e.g. hypotheticality represented as
distance). This function is most obvious in verbless sentences such as 
$sq"\text{bay}\, t\, i\, \text{\[is\] a \text{dog}}$ and $sq"\text{bay}\, t\, i\, \text{\[that\] is a \text{dog}}$, as in (24):

(24) Deixis: Location of types in the domain of instantiation

The diagram here shows the equation (dotted curve) of an abstract or generic type—"dog", representing the class of all dogs—to a particular instance of that type which has already been located in the DI (that is, the speaker and hearer have identified that instance as a specific dog they know or can see). Linking the type specification "dog" to a pronominal deictic establishes its identity as a specific dog by establishing its location in the DI, and the deictic thus serves as a reference-point for identifying a particular instance of a type specification. Where (a) and (b) differ is in the relative spatial locations of the type's instantiation (the dog in question) to the speaker (S), (a) pointing to a particular dog near the speaker and (b) pointing to one farther away.

In discourse terms, the function of a deictic is often to link topical, given, or thematic information to new or rhematic information—thus a deictic element may serve as a reference-point or anchor in the DI to which newer information can be attached and incorporated into the structure of the discourse episode. In Lushootseed sentences such as those illustrated in (24), this pattern is made overt in the syntax by a requirement that rhematic information be encoded in the syntactic predicate of the clause and that topical, thematic information be encoded as the syntactic subject (Beck 1996). This requirement is active not only in copular constructions like those in (24), but applies to all other sentence types as well, the least remarkable case (from a cross-linguistic perspective) being that of a "narratively-focused" sentence in which a new, rhematic event—represented by a verbal predicate—is linked to a topical subject (as, for example, in (19) above). Just as new participants must be identified with elements in the DI—that is, the type specification of a new participant (e.g. "dog") must be "grounded" or identified with some known entity ("that dog over there") so that its identity is accessible to the hearer—new events must also be identified with participants which have been previously identified in discourse. And, because subjects in Lushootseed are almost invariably topical, it is the subject of a clause which is most often used to identify a given instance of an event in discourse.

This deictic property of subjects is the basis of the most fundamental pattern of Lushootseed narrative, illustrated by the following passage from
the opening of “bibščəb ?i ti?iɬ suʔsuɬaʔs, tətyika” (“Little Mink and his younger cousin, Tetyika”), as told by Mr. Edward Sam:

(25) (a) tiʔiɬ bibščəb ḥə tiʔiɬ suʔsuɬaʔs, tətyika,
    D [rdp]+mink and D younger-cousin+3po Tetyika
    tiʔiɬ ḥəu+ɬ+suʔaʔ+u+bicid
    D [irr]+1po+np+tell+[caus]+2s
    “what I will tell you about [is] Little Mink and his younger cousin, Tetyika”

(b) ḥay, ?u+hiʔda(hə)b tiʔiɬ bibščəb ḥə tiʔiɬ suʔsuɬaʔs, tətyika
    [intj] [pnt]+troll D [rdp]+mink and D younger-cousin
    Tetyika
    “well then, Little Mink and his younger cousin, Tetyika, went trolling”

(c) ?u+hiʔda(hə)b ołgʷʔə?
    [pnt]+troll [plural]
    “[they] went trolling”8

(d) huy, šu+d+əxʷ tiʔiɬ əxʷəlu?
    [intj] see+[l.o.c.]+now D whale
    “well, [they] caught sight of Whale”

    [intj] annoyed+[caus]+now [plural]
    “[they] annoyed [him]”

(f) bapa+d+əxʷ ołgʷʔə? tiʔiɬ əxʷəlu?
    annoyed+[caus]+now [plural] D whale
    “[they] annoyed that whale”

(g) huy, xʷakʷʔi+s+əb+əxʷ ʔə tiʔiɬ əxʷəlu?
    [intj] sick-of+[appl]+[md]+now P D whale
    “well, [they] were gotten sick of by this whale”

---

8Hess (1993) says of the [plural] morpheme: “By means of this word speakers make explicit that a third person referent is plural whether as agent, patient, or possessor, e.g., ‘they’, ‘them’, ‘their(s)’” (p. 219). It is most likely not in itself a pronoun: it is not obligatorily sentence-second as are subject pronouns, nor does it have any of the other forms (such as subordinate or coordinative) that the pronouns do. In fact, it is not obligatory and can be left out when discourse makes the plural nature of the third person clear. It also cooccurs with the third-person subordinate clause pronoun -as and the possessive suffix -s. For the purposes of the discussion here it will be considered a “supplementary” morpheme, indicating that a third person actant (which in these sentences has been elided) is plural.
(h) huy, bəq't+t+ab+axʷ ʔə tiʔh əxʷəlu?

"well, they were swallowed by this whale"

(i) tìxʷəl|dat tiʔh [s]+dagʷabac+il+əxʷəl|əgʷə ʔə tiʔh three-days D np+in-small-space+[trm]+now [plural] P D əxʷəlu?
whale
"[they] were inside that whale for three days"
(lit. "[their] being inside of that whale [was] three days"")
(Hess 1993: 175 – 176, lines 5 – 13)

Here the speaker makes use of a strategy of linking rheomatic information to thematic material that he has previously located for the speaker in the DI—specifically, a topical participant (or participants) which acts as the syntactic subject, although this participant is often elided. Because any discourse episode requires a topic, the story begins with a topic-setting structure (Pu & Prideaux 1994)—in this case, a nominally-predicated sentence, (25a), that identifies the topical element to which subsequent text is linked in discourse. This is shown in (26):9

(26) Sentences (a) and (c)

Here, sentence (a) shows the linking of two types ("my telling to you" and "Little Mink")—one a type of event and the other a set of characters—to two instances (the deictics) that are identified with one another and locate both the event (the telling) and the characters (the topic of the coming narrative) to the here-and-now (tiʔh). The story-telling, a shared activity of the speaker and interlocutor, is considered more thematic and realized as the syntactic subject of the sentence whereas "Little Mink and his cousin" is rheomatic, and therefore implemented as sentence predicate; as a topic-setting structure, (a) establishes its rheme—"Little Mink and his cousin"—as discourse topic and this becomes the reference-point in discourse-space to which all new information in the episode is linked. The storyteller then links the established topic to the narrative overtly by using it as the subject of sentence (b), thereby linking the

---
9 Note that I have illustrated these sentences with a singular subject, Little Mink, rather than the plural subject in the texts; I have also eliminated sentence (b) from subsequent diagrams for ease of presentation.
first event in the story, Little Mink and his cousin’s going fishing, to the discourse topic established in line (a) and identifying the type of event ("trolling") to a specific instance of that event-type ("Little Mink and his cousin’s trolling"). In line (c), the sentence is repeated with an elided subject, as illustrated in the second part of (26) above.

Next, in sentence (d) a new participant, Whale, is introduced, but the discourse topic is still "Little Mink and his cousin", which remains syntactic subject: thus, the event—the sighting of Whale—is linked to Little Mink, as in (27):

(27) Sentence (d)

(Once again due to considerations of graphic presentation, the diagram has been simplified and does not include the instantiation of "whale" by its deictic). The next sentence, (e), contains no overt actants and relies on the fact that both “Little Mink and his cousin” and “whale” have been previously located in the DI to ground the new, rhematic information in the clause, the (transitive) event bapad “[s.o.] annoyed [s.o.]”. The primary grounding function for this stretch of discourse, however, still remains with the topical “Little Mink and his cousin” which is still the syntactic subject of the clause and, hence the agent/initiator of the event (i.e. Mink and Tetyika annoyed Whale, not the other way around). A further indication of this may be the storyteller’s feeling that a repetition of (e) is in order in (f), which makes overt the less topical participant, “Whale”. “Whale” also surfaces in overt form in (g) and (h), where new events are introduced, the event in each case being grounded in discourse by the elided subject, “Little Mink and his cousin”. Note that in these sentences, “Whale” surfaces as an oblique (passive agent) while “Little Mink and his cousin” remain syntactic subject, the passive preserving topic continuity.

Sentence (i) signals a change in topic with a marked structure—a sentence whose predicate is “three days”, the length of time that Little Mink and his cousin spent in the belly of the whale—and initiates a new discourse episode, as in (28). The information encoded in the DI in the previous episode is still active in (i), conferring thematic status on the subject—presupposed material based on the information in (h) (if Little Mink and his cousin were swallowed by Whale, they must have been inside him). In this particular story, “three days” is replaced in the following line by yet another topic, Little
Mink himself (who manages to trick Whale and kill him), "three days" being a rather limited area of discussion. The dynamics of topic-shifting await more detailed investigation, but the principle motivation for it seems to be the subject-topic relation and the inherently deictic nature of subjects in Lushootseed discourse.

Interestingly, the use of subjects as discourse-deictic elements that serve to link new events and participants to already established, topical material is highly reminiscent of a model of language comprehension proposed by Gernsbacher (1990). Using data from experiments measuring the time required to process linguistic input in English, Gernsbacher develops a three-phase model of how incoming linguistic information is organized into conceptual structures. The first phase in the process is termed "laying a foundation" and corresponds to the stage where the listener is processing completely new information (that is, information which contains no established discourse topic); information processing is slower in this phase, but once an appropriate foundation for the communication has been laid, subsequent information can be anchored to that foundation and is processed more rapidly. This is the "mapping" stage. Finally, when the structure is complete, the process of "shifting" occurs and a new topic is introduced, laying the foundation for a new discourse structure. These three stages seem to correspond very nicely to the pattern observed in (25), where the storyteller begins with a topic-marking structure to identify the figure on which the discourse is to be grounded (lays a foundation), narrates the next sequence of events with respect to that figure (maps the events onto the foundation), and then makes use of a second topic-shifting structure to signal the end of that particular episode (shifts to a new structure). Because of the rather transparent deictic nature of verbless sentences in establishing a direct identity between type and instantiation, they seem ideal candidates for the foundation-laying process. Making use of this structure in (25a), the storyteller establishes Little Mink and his cousin as discourse topics and then maintains them as topical, non-overt subjects, introducing new events and participants while at the same
time keeping the narrative firmly grounded on the communicative foundation he has set out, a foundation to which every sentence is linked both semantically (via the type-instantiation pattern illustrated in (26) and (27)) and grammatically (via the use of “Little Mink and his cousin” as the elided subject). While it is not always easy to establish clear connections between syntactic and psycholinguistic research, the parallels here are suggestive and certainly merit further investigation.

3 Conclusion

All in all, then, it seems that there is some motivation for the use of the term “subject” in Lushootseed. While it is certainly true that there is an unusually close “fit” between the semantic structure of an utterance and the syntactic role that each participant in an event is assigned by the grammar, this fit is not one-hundred percent and so the invocation of a syntactic role—however frequently the reference of this category corresponds to a given semantic role—seems justified. Even if this were not the case, the use of “subject” and “object” is highly desirable from a typological perspective, in that it allows closer comparison of the grammatical processes of Lushootseed with those of languages in which syntactic categories are perhaps not so closely aligned with the semantic roles they prototypically represent. The notion of subject seems also to be intimately linked to the organization of discourse, and the syntactic subject has an important function as a deictic element in narrative, serving to identify particular instances of an event type by linking that type to a topical participant which, by dint of being the most salient participant in the event, is realized syntactically as subject.

An interesting corollary of this notion of the subject as a discourse-deictic is the obvious similarity this function has to that of possessor which, in Cognitive Grammar, is analyzed as a deictic means of identifying one entity by reference to another, as in (29):

(29) Reference-point model of possession

![Diagram](based on Langacker 1991: 171)

According to Langacker (1991), possession does not always mean “ownership”, but signals an association of the possessed with the possessor
wherein the possessor is seen as a sort of an index or pointer (a "reference-point") which is used to identify one specific referent among several possible referents of the same class or type. Under this type of analysis, the possessed is analyzed as lying within the "dominion" of the possessor—that is, as being in that set of entities that can be identified by their (usually unique) association with the possessor, and so the possessor is taken to perform an essentially deictic function in locating a specific instance of the possessed.

Parallels between subject and possessor have been drawn in a number of theoretical frameworks, ranging from the analogous structural positions assigned to subject (SPEC of TP or IP) and possessor (SPEC of DP) in North American generativist paradigms to the common designation of subjects and some possessors as the first deep-syntactic actants of both nouns and verbs in Meaning-Text Theory (Mel'čuk 1988). While some of the motivation for these parallels is theory-specific and theory-internal, some of it is based on certain well-known cross-linguistic morphosyntactic similarities between possessors and subjects. The homophony of possessive and subject-pronominal paradigms, for instance, is not typologically unusual—and is attested in Mandinka, Bella Coola, Eskimo, and historically in Altaic (Baskakov 1971), to name but a few examples. As noted above, in many languages—including Lushootseed—the subject of non-finite participial or gerund clauses is expressed as a possessor, as in the examples in (9) above and the Tatar sentence here in (30):

(30) min+em kür+gān+em+ne bel+de
1s+[genitive] see+[past-participle]+1po+[accusative] know+[past]

"he found out that I had seen"
(lit. "he knew my having seen")

(Comrie 1981: 82)

Under Langacker's reference-point analysis of possessive constructions, the possessors in these examples serve as reference points—not for objects, but for reified events that are realized in the syntax as nominals. Because of their relatively high saliency, subjects—as we have seen for Lushootseed—also serve as reference-points for events and so it is not surprising that the subject is used in the same capacity when the clause is nominalized, giving us a contrast between deixis of reified and non-reified events: ordinary verbal expressions of events are located in the DI by the location of their syntactic subjects, while the same events when nominalized are—like nouns—located relative to their possessors.

A similar observation is made for the subjects of English deverbal nouns by Taylor (1994), who argues that whether the possessor of a deverbal noun in English is identified with the subject or with the object of the verb from which it is derived depends on which of the corresponding event-participants can be most effectively utilized to identify the particular instance of the event designated by the nominal. Thus, "Harry" in "Harry's love" is used to single out a particular instance of "love" for the hearer's attention—that
instance of "love" of which Harry is the protagonist—whereas "Harry's fright" directs the hearer towards an event in which Harry is frightened by some other entity and the possessor is assigned a semantic role which the verb "frighten" realizes as a syntactic object. While some deverbs (like "love") treat possessors as subjects and others ("fright") treat possessors as objects, many deverbs seem to allow for either interpretation, depending on the argument's "topicality" and its "informativity", the precision with which it allows the hearer to pinpoint a specific event of the type represented by the noun in a given context. The details of Taylor's argument are not directly relevant to the issue of Lushootseed participles, in which the possessor always refers to the clausal subject, but nonetheless these two criteria do seem to offer an explanation of why it is that participles—which retain more of their clausal properties than other deverbs—realize their subjects as possessors. In terms of topicality, as we have already seen, subjects in Lushootseed are almost invariably more topical than objects, whereas on a scale of informativity it seems likely that subjects will be rated highly by dint of their use as discourse-deictics. Indeed, Taylor's definition of informativity, when translated into spatial metaphor, seems to be precisely a measure of a participant's usefulness as a deictic: identifying a particular instance of an event type means locating that event in the DI relative to the speaker, something which we have already seen to be an important function of subjects in Lushootseed discourse. What is particularly interesting is that the data presented here seems to extend Taylor's analysis of deverbal nouns beyond the level of the participle to that of the finite clause, and thus offers a cognitive explanation of the morphosyntactic overlaps observed cross-linguistically between subject and possessor, and between subject and topic—illustrating once again the importance of recognizing the presence of the syntactic subject in Lushootseed as a benchmark for analysis of discourse and typological comparison.
